3196 *i-FRAME*[®]

ANSI Process Pump with *i-ALERT*[®]
Patented Intelligent Monitoring

ITT

ENGINEERED FOR LIFE

Proven Performance

Over One Million Process Pump Installations Worldwide

When the Goulds 3196 ANSI Standard Dimension Process Pump was first introduced in 1961, it immediately became the standard for the industry.

Today, the number of installations attest to its remarkable performance. Users in chemical, petrochemical, pulp & paper, primary metals, food & beverage and general industries know they can make no better choice than the best — Goulds Model 3196.

Before Selecting A Process Pump

Consider the Four Design Features For Extended Pump Performance

In order to select a chemical process pump wisely, consideration must be given to design features that provide long-term reliable performance. The pump must be designed for optimum shaft seal and bearing life to prevent the failure of these two primary causes of pump downtime.

1 Impeller

Must be designed for long-term, maintainable performance and minimum hydraulic loads for maximum reliability.

2 Seal Chamber

Must be designed for favorable seal environment — proper heat dissipation and lubrication of seal faces. The design must also be able to handle tough services: liquids containing solids, air or vapors.

FULLY OPEN IMPELLER

Best design for the Chemical Process Industries services. Ideally suited for corrosives and abrasives, handles solids and stringy fibers with ease. Allows for simple restoration of clearances when wear takes place. Back pump-out vanes reduce pressure on the shaft seal, reduce axial thrust on the bearings.

ENGINEERED SEAL CHAMBERS

BigBore™ and TaperBore™ PLUS seal chambers allow seals to run cooler with better face lubrication. Keep solids, air and vapors away from the seal faces for extended seal life.

i-FRAME® POWER ENDS

Patented design maximizes reliability and Mean Time Between Failure (MTBF). Severe-duty bearings increase bearing life 2-5 times, while onboard condition monitor gives visible indication of general pump health. Backed by a five-year standard warranty.

PUMP MOUNTING SYSTEM

Critical for reliability ... rigid baseplate prevents distortion, maintaining pump/motor alignment; corrosion resistant in severe environments. Designed for low vibration and to withstand pipe loads. Meets total range of plant requirements, easier installation and maintenance.

3 Power End

Must be designed for optimum bearing life, effective oil cooling, and minimum shaft deflection. Onboard condition monitoring provides early warning of potential failures, before they occur.

4 Baseplate

Must be rigid, and able to withstand forces and moments of plant piping systems.

Consider the Total Cost of Ownership

Consider the fact that over a 20-year ANSI pump life, 92% of the total costs are maintenance, operation and installation. Only 8% is the initial pump purchase cost. Select a process pump that maximizes reliability (low maintenance cost), has long-term maintainable hydraulic performance (low operating cost) and is installed on a rigid baseplate. Energy and maintenance costs during the life of a process pump can be more than 10 times its purchase price.

Fully Open Impeller

Acknowledged Best Design for CPI Services

The open impeller is the acknowledged best design for process services. It is ideally suited for corrosive/erosive liquids containing solids and stringy materials. The most reliable pumps feature open impellers as standard.

See The Difference

Remarkably, Goulds had performance in mind when the Model 3196 standard dimension process pump was developed in 1959. Of timely significance was the decision to feature a fully open impeller rather than an enclosed type. There are three excellent reasons why:

- Greater wear area for longer life
- Renewable performance for reduced repair costs
- Minimum hydraulic loads for maximum mechanical reliability

1. Two Times More Wear Area

Longer Life, Reduced Repair Costs

The most critical wear areas of a pump are the casing and stuffing box/seal chamber clearances. At a given wear rate, the larger wear area means longer life.

Open Impeller

Wear is uniform throughout larger area; no concentrated wear... extended life, reduced repair part cost.

Wear Area Calculation (10 inch dia. impeller)
Area Wear Surface = $\pi r^2 = \pi(5)^2 = 79 \text{ in}^2$
Total Wear Area (Front & Back) = $2 \times 79 = 158 \text{ in}^2$

Enclosed Type Impeller

Less wear area with concentrated wear at nose of impeller ... higher repair part cost.

Area Nose Ring = $2\pi rW = 2 \times \pi \times (5) \times (.9) = 5 \text{ in}^2$
Area Back Cover = $\pi r^2 = \pi(5)^2 = 79 \text{ in}^2$
Total Wear Area = $5 + 79 = 84 \text{ in}^2$

2. Maintained High-Performance

Long Pump Life

It is common knowledge that as a pump wears, the performance decreases. Goulds open impeller can be adjusted, simply and quickly, to compensate for wear and renew performance. The enclosed type impeller cannot be adjusted. Performance renewal requires new or repaired casing and impeller.

Open Impeller

Original performance can be re-set (at the bench or on-site) with external impeller adjustment using a common open-end wrench and feeler gauge. *It is done in a matter of minutes.*

Typical reduction in performance due to wear (.010 inch per year) on any ANSI pump.

Enclosed Type Impeller

Front nose ring of impeller cannot be adjusted to provide 'as new' performance. Parts must be replaced or repaired.

3. Minimum Hydraulic Loads

Extended Seal and Bearing Life

Goulds open impeller is engineered to assure minimum radial and axial thrust loads; controlled clearances between front and back of impeller minimize radial loads; back pump-out vanes control and reduce axial thrust. Bearing life is guaranteed.

Engineered For Long Life

Back vane height/angle and shroud design are engineered to minimize hydraulic loads throughout the life of the pump. Bearing life is guaranteed.

As the open impeller is adjusted and performance renewed, back pump-out vanes control axial thrust.

Bearing and seal life are maintained — unaffected by adjustment.

- Control Axial Thrust
- Low Radial Loads
- Control Seal Chamber Pressure
- Guaranteed Bearing Life
- Extended Seal Life

Goulds Engineered Seal Chambers

Extend Seal Life And Lower Maintenance Costs

Seal Environment is Critical for Extended Seal Life

The number one cause of pump downtime is failure of the shaft seal. These failures are normally the result of an unfavorable seal environment such as improper heat dissipation (cooling), poor lubrication of the seal faces, or seals operating in liquids containing solids, air or vapors.

Goulds engineered seal chambers are designed to provide the best seal environment for any sealing arrangement.

Enlarged bore seal chambers (BigBore™ and TaperBore® PLUS) with increased radial clearance between the mechanical seal and seal chamber provide better circulation of liquid to and from seal faces. Improved lubrication and heat removal extend seal life and pump uptime. The bottom line is lower maintenance costs.

Engineered Seal Chamber Selection Guide

A Ideally suited B Acceptable C Not Recommended	Service

Goulds 3196 *i-FRAME*[®]

Goulds Dynamic Seal

Goulds TaperBore[®] PLUS

How it Works

The unique flow path created by the Vane Particle Ejector directs solids away from the mechanical seal, not towards the seal as with other tapered bore designs. And, the amount of solids entering the bore is minimized. Air and vapors are also efficiently removed.

On services with or without solids, air or vapors, Goulds Pumps TaperBore[®] PLUS is the effective solution for extended seal and pump life and lower maintenance costs.

- 1 Solids/liquid mixture flows toward mechanical seal / seal chamber.
- 2 Turbulent zone. Some solids continue to flow toward shaft. Other solids are forced back out by centrifugal force (generated by back pump-out vanes).
- 3 Clear liquid continues to move toward mechanical seal faces. Solids, air, vapors flow away from seal.
- 4 Enhanced streamline created by Vane Particle Ejector. Solids, air, vapor liquid mixture exit seal chamber bore.
- 5 Flow in TaperBore[®] PLUS seal chamber assures efficient heat removal (cooling) and lubrication. Seal face heat is dissipated. Seal faces are continuously flushed with clean liquid.

Benefits of Dynamic Seal:

- Eliminate use of seal water
- Eliminate pumpage contamination and product dilution
- Reduce utility cost
- Eliminate problems associated with piping from a remote source
- Eliminate need to treat seal water
- Considerably less expensive than a slurry mechanical seal

Stuffing Box Cover

Repeller

Repeller Plate

Besides being available as a complete unit, any Goulds 3196 can be easily field-converted to Dynamic Seal. Retrofit kits are available.

Eliminate Sealing Problems, Reduce Maintenance Costs

On tough pumping services, especially corrosives and slurries, mechanical seals require outside flush and constant, costly attention. Even then, seal failures are common, resulting in downtime.

Goulds Pumps offers a solution: The Dynamic Seal which, simply by fitting a repeller between the stuffing box cover and impeller, eliminates the need for a mechanical seal.

Sealless Solutions

Not all process pump applications can be sealed with optimum reliability. Goulds ANSI dimensional magnetic drive sealless process pumps are perfect solutions to mechanical seal or environmental sealing problems. The 3296 EZMAG metal magnetic drive process pump has a revolutionary bearing cartridge design for maximum reliability and ease of maintenance. For tough corrosive services Goulds also offers ETFE[®] and PFA-lined magnetic drives available in horizontal, vertical or self-priming configurations to meet all your process needs.

Model 3296 EZMAG Model 3298 Model V3298

Goulds Patented *i-FRAME*[®] Power Ends

Extended Pump Life Through Intelligent Design

Goulds *i-FRAME* Power Ends are the result of 160 years of design experience, customer interaction, and continuous improvement. Customers get extended Mean Time Between Failure (MTBF) and lower life cycle costs (LCC) ... guaranteed!

1 *i-ALERT*[®] Condition Monitor

The heart of the *i-Frame*, the *i-ALERT* condition monitor unit continuously measures vibration and temperature at the thrust bearing and automatically

indicates when pre-set levels of vibration and temperature have been exceeded, so that changes to the process or machine can be made before failure occurs. A visual indication of pump health makes walk-around inspections more efficient and accurate. The result is a more robust process to monitor and maintain all your ANSI pumps so that your plant profitability is maximized. (*i-ALERT*[®] 2 Bluetooth Equipment Health Monitor option available. See page 16 for more information.)

2 Inpro VBXX-D Hybrid Bearing Isolators

Most bearings fail before reaching their potential life. They fail for a variety of reasons, including contamination of the lubricant. INPRO VBXX-D has long been considered the industry standard in bearing lubricant protection. The *i-FRAME* now improves upon that design by offering stainless steel rotors, for maximum protection against contaminants and the corrosive effects of seal leakage or environmental conditions. These seals are non-contacting and do not wear.

A reliability program centered around walk-arounds captures equipment condition on average once a month; the failure process, however, can begin and end quite frequently within this time period.

3 Optimized Oil Sump Design

Internal sump geometry is optimized for longer bearing life. Sump size increased by 10%-20% results in better heat transfer and cooler bearings. Contoured design directs contaminants away from bearings, to the magnetic drain plug for safe removal.

Larger Means Cooler

■ Industry Average

4 Shaft and Bearings Engineered for Maximum Reliability

Every 3196 i-Frame Power End is engineered and manufactured for optimal pump performance and increased MTBF.

5 L*Ti* Power End for High Load Applications

Increased L'10 Bearing Life 150% to 200% on the Toughest Applications

Ideal for tough conditions when a power end is pushed beyond ANSI limits; operating at low flows and higher heads, pumping high specific gravity liquids, fluctuating process conditions, overhung belt drive.

Oversized shaft and bearing assembly significantly expands the limits for long, trouble-free bearing and seal life. On high load applications, the *LTi* power end improves bearing life 150% - 200%; oil operating temperature reduced by 45°F (25°C).

Duplex thrust bearings (40°/40° angular contact) with machined brass cages, are ideally sized for high load applications.

Oversized shaft with duplex thrust bearings provide increased L'10 by 40%.

ANSI B73.1 Shaft Specification	Meets	Exceeds
Diameter Tolerance		✓
Surface Finish		✓
Runout	✓	
Deflection		✓

The rugged shaft and bearing combination maintains shaft deflection of less than 0.002 inches at all operating points. The result is longer seal and bearing life.

Premium severe-duty thrust bearings increase bearing fatigue life.

- High purity steels have fewer inclusions than standard steel – better grain structure and wear resistance.
- Heat treatment of bearing elements to SO stabilization levels provides superior thermal stability for increased service life.
- Bearing Balls are manufactured to at least one ISO grade above standard (ISO P5 for ring running accuracy and ISO P6 for dimensions). The result is reduced vibration and noise for improved shaft guidance.

Flinger/channel oil lubrication system provides 30% increased L'10 life; 15°F (8°C) reduced oil temperature.

Our Guarantee

We are so confident that the *i-FRAME* is the most reliable Power End in the industry, that we are proud to offer a standard 5-year warranty on every *i-FRAME* ANSI Process Pump.

3196 i-FRAME[®] Process Pumps

i-ALERT[®] CONDITION MONITOR

Constantly measures vibration and temperature at the thrust bearing. Colored LED's indicate general pump health. Provides early warning of improper operation before catastrophic failure occurs. (i-ALERT[®] 2 Bluetooth Equipment Health Monitor option available. See page 16 for more information.)

DUCTILE IRON FRAME ADAPTER

Material strength equal to carbon steel for safety and reliability.

CONTINUOUS PERFORMANCE

Original flow, pressure and efficiency are maintained by simple external adjustment resulting in long-term energy and repair parts savings.

PREMIUM SEVERE-DUTY THRUST BEARINGS

Premium bearings using improved tolerances and cleaner steel provide reduced assembled runout and longer bearing life.

INPRO VBXX-D HYBRID LABYRINTH SEALS

Prevents premature bearing failure caused by lubricant contamination or loss of oil. Stainless steel rotors for optimal performance in corrosive environments.

HEAVY DUTY SHAFT AND BEARINGS

Rigid shaft designed for minimum deflection at seal faces—less than 0.002 in. (.05 mm). Bearings sized for 10-year average life under tough operating conditions. Available with or without shaft sleeve.

OPTIMIZED OIL SUMP DESIGN

Increased oil capacity provides better heat transfer for reduced oil temperature. Bearings run cooler and last longer. Contaminants directed away from bearings to magnetic drain plug.

ONE - INCH BULL'S EYE SIGHT GLASS

Assures proper oil level critical to bearing life. Can be mounted on either side of pump for installation flexibility.

i-FRAME[®] POWER END

Designed for reliability and extended pump life, backed with a 5-year warranty.

MAGNETIC DRAIN PLUG

Standard magnetic drain plug helps protect bearings and prolong life.

CASING

- Bonus casing thickness: Class 150 pumps feature Class 300 wall thickness as standard; increased reliability and maximized casing life.
- Top centerline discharge for air handling, self venting.
- Back pull-out design for ease of maintenance.
- Integral casing feet prevent pipe load misalignment – maximized seal and bearing life.
- Serrated flanges standard for positive sealing against leakage. Meets ANSI B16.5 requirements. Class 150 FF flanges standard, optional Class 150 RF, 300 FF/RF.

FULLY OPEN IMPELLER

Acknowledged best design for CPI services – solids handling, stringy material, corrosives, abrasives. Two times the wear area of closed-type impellers for longer life. Back pump-out vanes reduce radial thrust loads and seal chamber pressure.

SEALING FLEXIBILITY

Wide range of sealing arrangements available to meet service conditions. Engineered seal chambers improve lubrication and heat removal (cooling) of seal faces for extended seal life and pump uptime.

POSITIVE SEALING

Fully confined gasket at casing joint protects alignment fit from liquid, makes disassembly easier.

RIGID FRAME (AND CASING) FEET

Reduce effects of pipe loads on shaft alignment; pump vibration reduced.

Baseplate Mounting Systems

Goolds Pumps offers a complete range of pump mounting systems to meet plant requirements; make installation and maintenance easier.

Options

Goolds Pumps offers a complete range of pump mounting systems to meet plant requirements; make installation and maintenance easier.

Seal Flush Plans

All ANSI B73.1 seal flush and cooling plans are available to control emission levels and meet seal installation requirements of user preference.

CPI PLAN 7311

By-pass flush lubricates single seal faces.

CPI PLAN 7353

Pressurized circulation lubricates double seal faces.

High and Low Temperature Capability

Options are readily available for high and low temperature applications or where pumpage temperature must be controlled.

HEAT JACKET

Economical clamp-on jacket provides practical method of heating or cooling the casing. Excellent heat transfer characteristics. Easy to install or remove for pump servicing.

JACKETED SEAL CHAMBER

Maintains proper temperature control of sealing environment. Ideal for maintaining temperature for services such as molten sulphur and polymerizing liquids. Available in BigBore and TaperBore® designs.

BEARING FRAME FINNED COOLER

Directly cools oil for lower bearing operating temperature. Requires minimum cooling water. Corrosion resistant construction. Recommended for temperatures over 350°F (177°C) when using conventional oil. When synthetic oil is used, pump can run up to 450°F without cooling. Above 450° add for high temperature option.

High Temperature Features

For operation to 700°F (371°C)

- Jacketed Stuffing Box/ Seal Chamber
- Finned Cooler
- 316 Stainless Steel Shaft
- Graphite Impeller O-ring
- Graphite Casing Gasket

Options

i-ALERT®2 Equipment Health Monitor

What it Does:

Monitor

Tracks vibration, temperature & run-time hours 24/7/365.

Alarm

Checks every five minutes & alarms if equipment is outside normal operating conditions.

Trend

Stores data once per hour & on alarm for 30 days. Stores the weekly average, minimum & maximum up to 5 years.

Analyze

Diagnose machine faults with vibration tools
Fast Fourier Transform (FFT) & Time Wave Form Analysis.

Environment

Rated for any industrial environment. IP67 water & dust resistant. Intrinsically Safe with a 3-year battery life (use dependent).

Wireless

Sync data via Bluetooth Smart enabled smartphones and tablets.

How it Works:

1. ACTIVATE

The *i-ALERT* devices are light activated by removing the sticker. The *i-ALERT*® device begins wirelessly broadcasting once activated.

2. AUTO CONFIGURATION

The *i-ALERT2* device averages the vibration over 25 hours of run-time and sets the alarm levels to 2 x average (0.1-1.5ips minimum). Temperature alarm default to 80°C (176°F)

OR

2. MANUAL CONFIGURATION

User manually sets the alarm thresholds via the *i-ALERT*® mobile application.

3. Monitor

The *i-ALERT* device checks every 5 minutes. If two consecutive readings are above alarm threshold the *i-ALERT* device will go into alarm.

Spend less time collecting data and more time fixing problems. The *i-ALERT*®2 mobile app has the ability to scan multiple *i-ALERT*®2 devices within range to quickly and safely inspect multiple machines.

Dashboard

Simple, intuitive dashboard to track vibration, temperature, run-time & battery life.

Trending

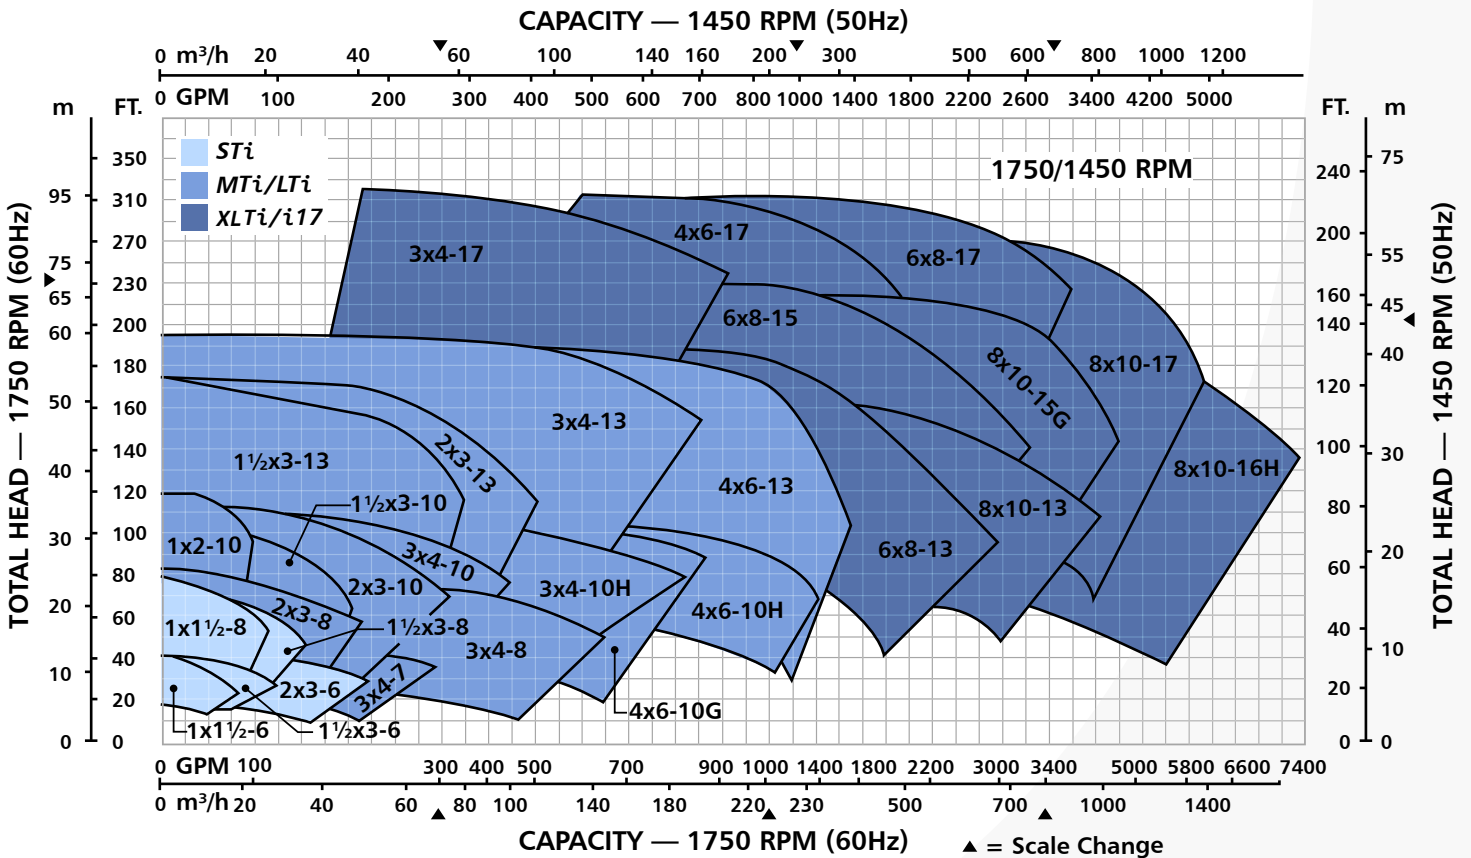

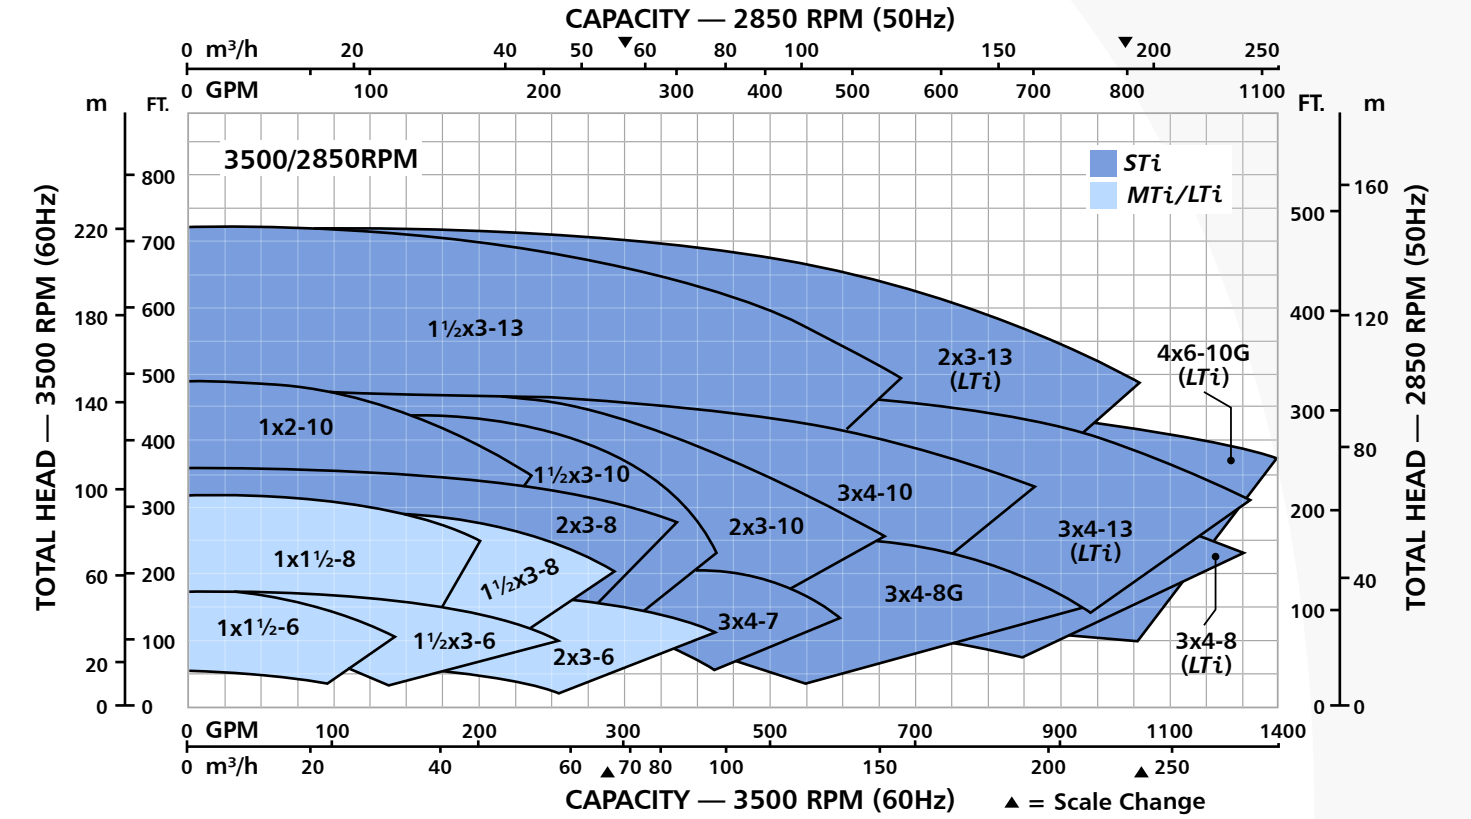

Trend vibration, temperature, & kurtosis to monitor any changes in the equipment operation.

BOM

Load the as built of materials based on the pump serial number.

Shaft Deflection Index (L ³ /D ⁴) (With Sleeve)		143	116	48	62
	(Less Sleeve)	64	63	29	25
Sleeve	O.D. thru Stuffing Box/Seal Chamber	1.375 (35)	1.75 (45)	2.125 (54)	2.5 (64)*
Bearings	Radial	6207	6309	6311	6313
	Thrust	3306	3309	7310	3313
	Bearing Span	4.125 (105)	6.75 (171)	6.875 (164)	9.25 (235)
BigBore™ Seal Chamber	Bore	2.875 (73)	3.5 (89)	3.875 (98)	4.75 (120)*
Stuffing Box	Bore	2 (51)	2.5 (64)	2.875 (73)	3.375 (86)*
Power Limits	HP (kW) per 100 RPM	1.1 (.82)	3.4 (2.6)	5.6 (4.2)	14 (10.5)**
Temperature	Maximum Liquid Temperature – Oil/Grease Lubrication without Cooling	350°F (177°C)			
	Maximum Liquid Temperature – Oil Lubrication with High Temp. Option	700°F (370°C)			
Casing	Corrosion Allowance	.125 (3)			

* 17 inch sizes have 2¼ inch (57) shaft diameters in stuffing box/seal chamber with sleeve. Shaft sleeve O.D. is 2¾ inches (70) for packing and 2½ inches (64) for mechanical seals. Seal chamber bore is 4¾ inches (121). Stuffing box bore is 3¾ inches (92).

** 17 inch sizes power limit per 100 RPM is 20 HP (15kW).

Process Industry Practices (PIP) Compliance

The standard design features of Goulds 3196 (ANSI B73.1M) and 3996 (ANSI B73.2M) pumps meet ASME/ANSI standards. In addition, both models can be manufactured to comply with PIP Specifications for application of horizontal and vertical in-line ANSI process pumps.

Model 3196 meets B73.1M and RESP73H

Model 3996 meets B73.2M and RESP73H

Other Features For Safety & Reliability

C-FACE ADAPTER
i-FRAME power ends accommodate optional C-face motor adapter – simplifies pump/motor alignment.

3196CC (Close Coupled)
Certain sizes of the 3196 are available in a close coupled configuration which saves space, requires less maintenance and needs no alignment.

CENTERLINES-MOUNTED CASING
For high temperature services (500° to 700° F/260° to 370°C).

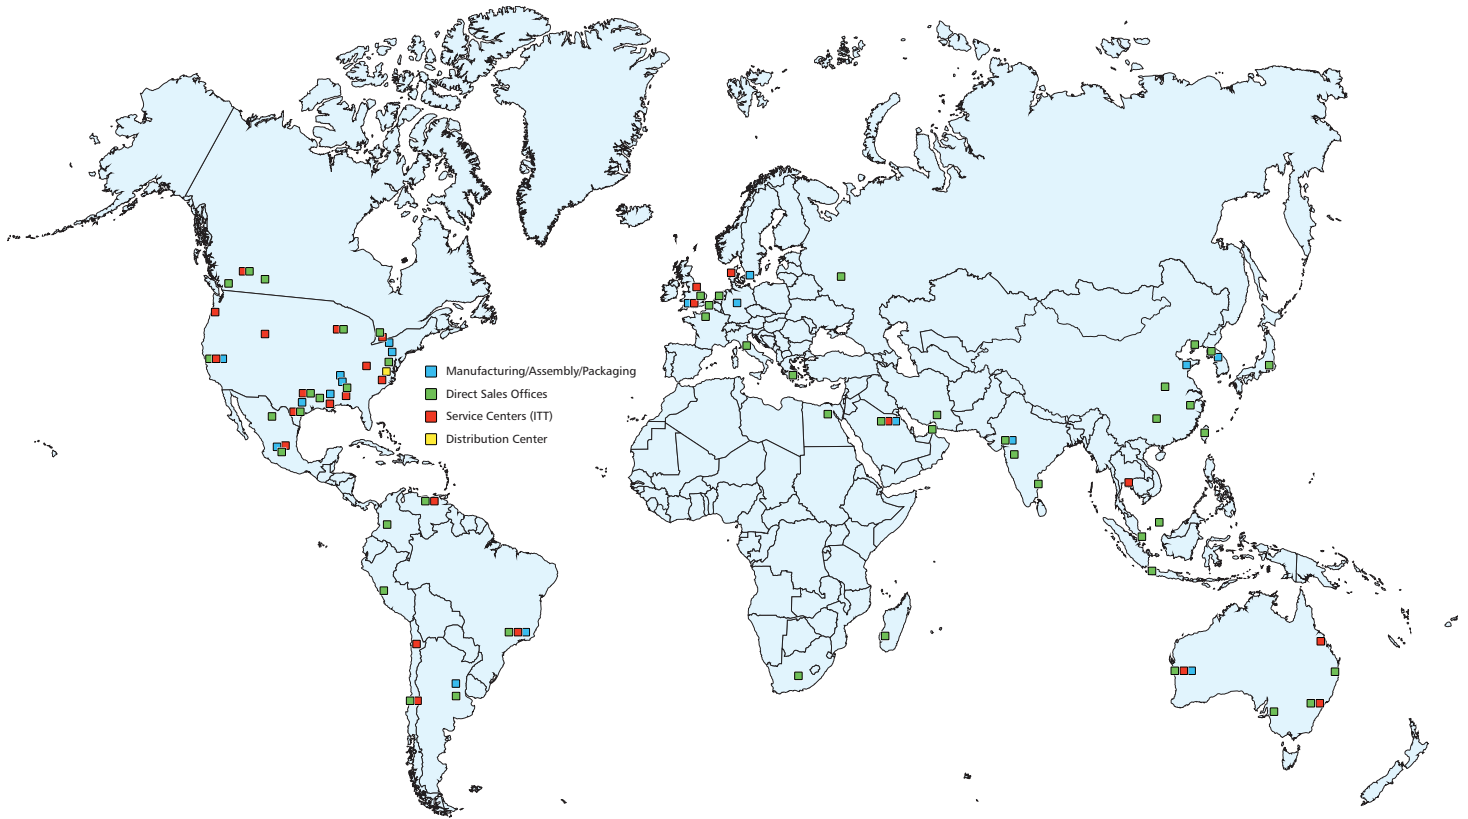

ANSI COUPLING GUARD
Meets all requirements of ANSI B15.1 specifications.

SHAFT GUARD
When a guard around all rotating shaft parts is required.

PRO services

Reliability has no quitting time.

Building on over 160 years of Goulds Pumps experience, PRO Services provides an array of services focused on reducing equipment total cost of ownership (TCO) and increasing plant output, including predictive monitoring, maintenance contracts, field service, engineered upgrades, inventory management, and overhauls for pumps and other rotating equipment.

Your Total Solution For Equipment Life Cycle Optimization
